

3TS RTMS is a modular, in-house security platform combining automated network asset discovery with continuous CVE vulnerability tracking. Operating directly within the client's infrastructure, it provides IT and security teams with real-time visibility and centralized control over their attack surface via an intuitive web interface.

Features

Automated Network Discovery. Continuously scans and maps connected assets across multiple subnets, identifying managed and unmanaged devices.

Real-Time CVE Synchronization. Feeds live vulnerability intelligence directly from the NIST NVD, automatically correlating newly published CVEs against your asset inventory.

Multi-Subnet Distributed Architecture. Deploys lightweight probes across segregated VLANs, remote branches, or complex environments, funneling visibility back into a unified control plane.

Modern Web-Based Dashboard. Delivers a responsive, intuitive interface backed by a robust PostgreSQL engine to visualize your attack surface, prioritize critical exposures, and track remediation over time.

Automated Alerting. Pushes real-time alerts on newly detected high-severity risks via email and team collaboration platforms or integrates directly with your existing SOC.

Non-Intrusive Deployment. Operates seamlessly over existing brownfield infrastructures

Key Benefits

Actionable Risk Visibility. Eliminates blind spots by transforming complex technical data and security alerts into clear, prioritized business tasks.

Rapid Threat Containment. Identifies vulnerabilities the moment new devices or software appear on your network, drastically shrinking your window of exposure.

Effortless Audit & Compliance. Delivers continuous proof of compliance for European frameworks (such as NIS2 and ISO 27001) without tedious manual audits.

High ROI & Cost Efficiency. Operates at 3 to 5 times lower cost than traditional enterprise competitors by avoiding expensive per-device licensing fees and heavy infrastructure overhead.

Immediate Time-to-Value. Deploys in minutes with zero disruption. Automated network discovery gives you immediate, actionable security visibility from day one.

Total Digital Sovereignty. Designed as a 100% self-hosted, on-premises solution. All confidential network data and findings remain strictly inside your walls, ensuring full compliance with European privacy standards and eliminating third-party cloud risks.

Enterprise-Grade Security. Operates completely offline with no outbound exposure, safeguarding your critical assets with highest-standard protection.
